IN THE CLAIMS

Please amend the claims as follows:

Claim 1 (Original): A method of manufacturing molded materials of a thermosetting resin composition in a method of granulating a molding material of the thermosetting resin composition, characterized in that a sheet producing step for transferring the molding material in a molten state to a subsequent stage while processing the same material into a sheet type material of a predetermined thickness, a first processing step for cutting the sheet type material, which has thus been transferred to a stage for carrying out this step, in parallel with the transfer direction thereof to a predetermined width, and thereby obtaining laterally arranged rows of processed bodies of elongated string-like materials, a step of cutting the processed body, which is obtained in the first processing step, to a predetermined length with respect to the transfer direction, a transfer direction changing step for transferring the processed body, which has been subjected to the cutting step, to a subsequent stage by changing the transfer direction of the processed body at 90 degrees with respect to the longitudinal processed body cutting line, and a second processing step for cutting the processed body, the transfer direction of which has been changed, in parallel with the processed body transferring direction to a predetermined width, and thereby obtaining granulated materials are carried out in order.

Claim 2 (Original): A method of manufacturing molded materials of a thermosetting resin composition according to Claim 1, wherein a second processing step for making a multiplicity of slits in the transfer-direction-changed processed body after the transfer direction changing step has been carried out, in parallel with the transfer direction of the processed body to a predetermined width, and thereby obtaining a processed body of longitudinally arranged rows of elongated string-like materials having longitudinal slits of a

predetermined width, and a step of applying an external force to the processed body of longitudinally arranged rows of elongated string-like materials obtained in the second processing step, and thereby obtaining granulated materials are carried out in order.

Claim 3 (Original): A method of manufacturing molded materials of a thermosetting resin composition in a method of granulating a molding material of the thermosetting resin composition, characterized in that a sheet producing step for transferring the molding material in a molten state to a subsequent stage while processing the same material into a sheet type material of a predetermined thickness, a first processing step for making a multiplicity of slits in the sheet type material, which has been transferred to a stage for carrying out this step, in parallel with the transfer direction to a predetermined width, and thereby obtaining a sheet type processed body in which a multiplicity of longitudinal slits are formed, a step of cutting the sheet type processed body, which has been obtained in the first processing step, to a predetermined length with respect to the transfer direction, a transfer direction changing step for transferring the processed body, which have been subjected to the cutting step, to a subsequent stage by changing the transfer direction of the processed bodies at 90 degrees with respect to the longitudinal processed body cutting line, a second processing step for cutting the processed body, the transfer direction of which has been changed, in parallel with the processed body transferring direction to a predetermined width, and thereby obtaining a processed body of laterally arranged rows of elongated string-like materials in which a multiplicity of lateral slits are formed in a longitudinally spaced manner, and a step of applying an external force to the processed body of laterally arranged rows of elongated string-like materials, which have been obtained in the second processing step, and thereby obtaining granulated materials are carried out in order.

resin composition according to Claim 3, wherein a second step of making a multiplicity of slits after the execution of the transfer direction changing step in the processed body, the

Claim 4 (Original): A method of manufacturing molded materials of a thermosetting

predetermined width, and thereby obtaining a sheet type processed body having generally

transfer direction of which has been changed, in parallel with the transfer direction to a

checker-patterned slits, and a step of applying an external force to the sheet type processed

body obtained in the second processing step, and thereby obtaining granulated materials are

carried out in order.

Claim 5 (Original): A method of manufacturing molded materials of a thermosetting

resin composition according to Claim 1, wherein the sheet producing step is carried out by

rolling the molding material in a molten state the temperature of which is regulated to a

temperature of 70 to 130°C with rolling rolls, obtaining a sheet type material of 70 to 130°C,

and transferring the sheet type material to a subsequent stage.

Claim 6 (Original): A method of manufacturing molded materials of a thermosetting

resin composition according to Claim 1, wherein the thermosetting resin is a phenol resin, an

epoxy resin, a polyimide resin or a polyester resin.

Claim 7 (Original): A method of manufacturing molded materials of a thermosetting

resin composition according to Claim 1, wherein the granulated materials have a rectangular

cross section 0.5 to 4 mm square.

Claims 8 – 11 (Canceled)
